

# QGIS & Web Mapping

Standard GIS & Web Based Tools

Web Mapping Training 101

# Why QGIS?

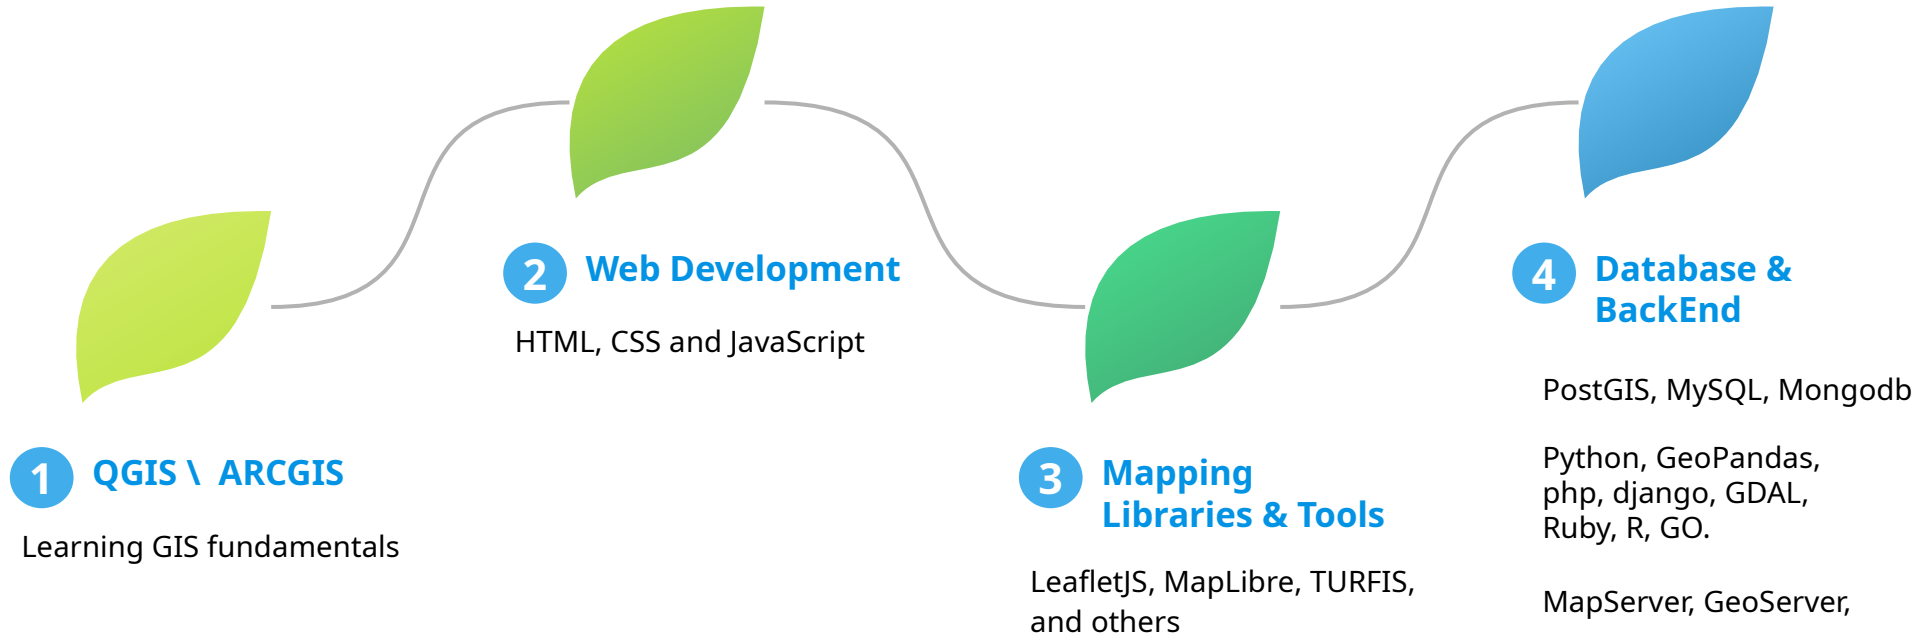

- 01 Open Source Software ( Free)**  
It's FOSS, means anyone can download, use, and the original source code under is available under certain licenses
- 02 Flexibility & Cross Platforms**  
You can run it on Linux, PC or MacOS,. Also, you can run it on Virtual Machine as well.
- 03 Large Growing Community**  
QGIS gains that popularity and user's groups in many fields
- 04 Support & Documentation**  
From Beginners to seasoned users will help you to adopt it with tutorials and free resources to learn QGIS.

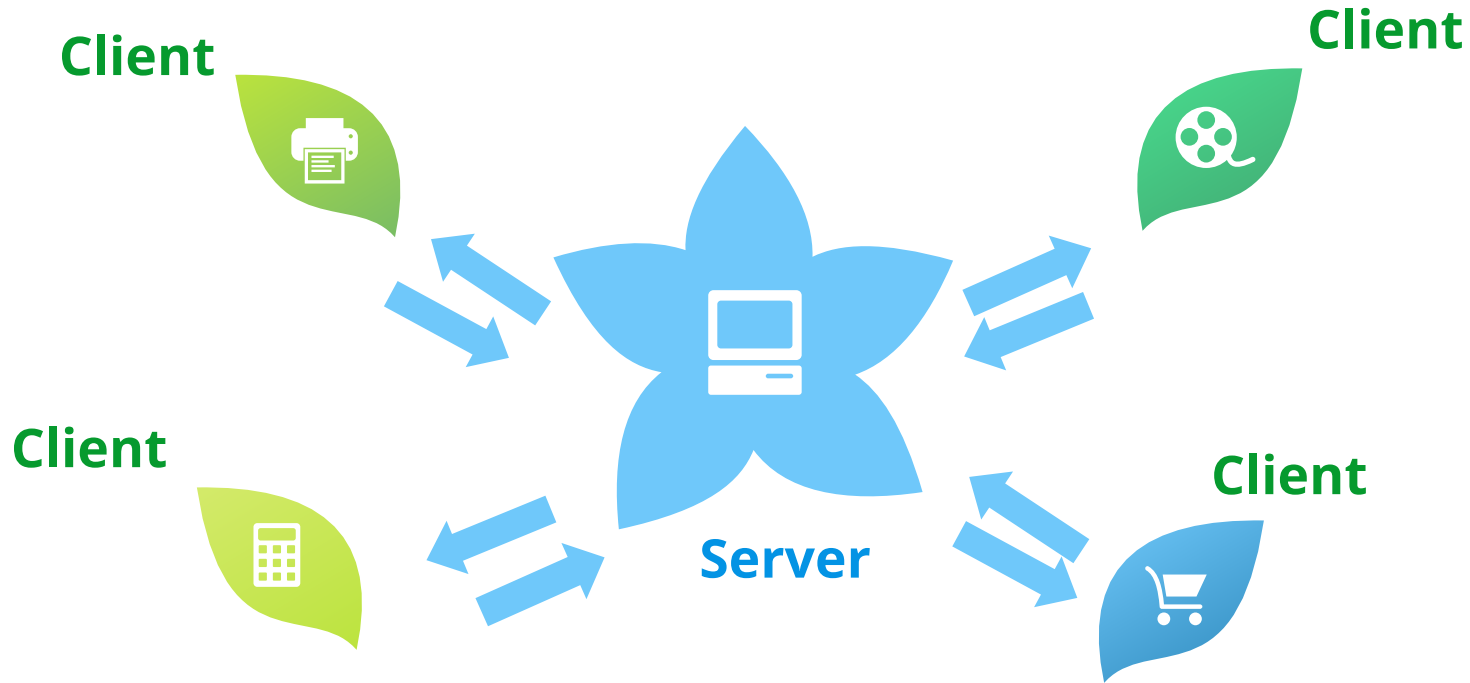

# Digital Mapping

Web Development & GIS

# What is Digital Mapping?

# Client-Server Architecture

# Servers

## File Servers

Store & Send/Receive  
Documents

## Web Servers

Store & Send Web Pages  
using HTML, CSS,  
JavaScript & JSON

## Database Servers

Store & Send/Receive  
Data

# Uniform Resource Locator (URL):

Tells the browser where to locate the information.

Protocol: http:// or https://, FP, File

Hostname: localhost, Domain (example.com, example.org)

File Name: page name

Example:

<https://www.google.com/index.html>

# Web Development Basics

Client – Web Browser

- Chrome
- Firefox

Editor

- VS Code
- Brackets
- Others

Web Server – XAMPP:

- Cross Platform
- Apache Web Server
- MariaDB Database
- PHP

# Before You Start!

**What was the Question?**  
**Be specific and refrain from generalization...**

**Do you have the skills or the Tools to achieve your goals?**

**What are your cost barriers? Being mindful of your resources. Decide early what mapping technology are you going to use?**

- Google Maps API,
- LeafletJS
- Mapbox, OSM, and more
- Leaflet Open-source

# Data Is Crucial!

What kind of data do you need?

You need Vector or Raster Datasets?

Is it available for FREE or otherwise?

Create your own data?

Think about other Data Types:-

- Geojson
- Shapefiles
- KMZ

Or Database Format as:

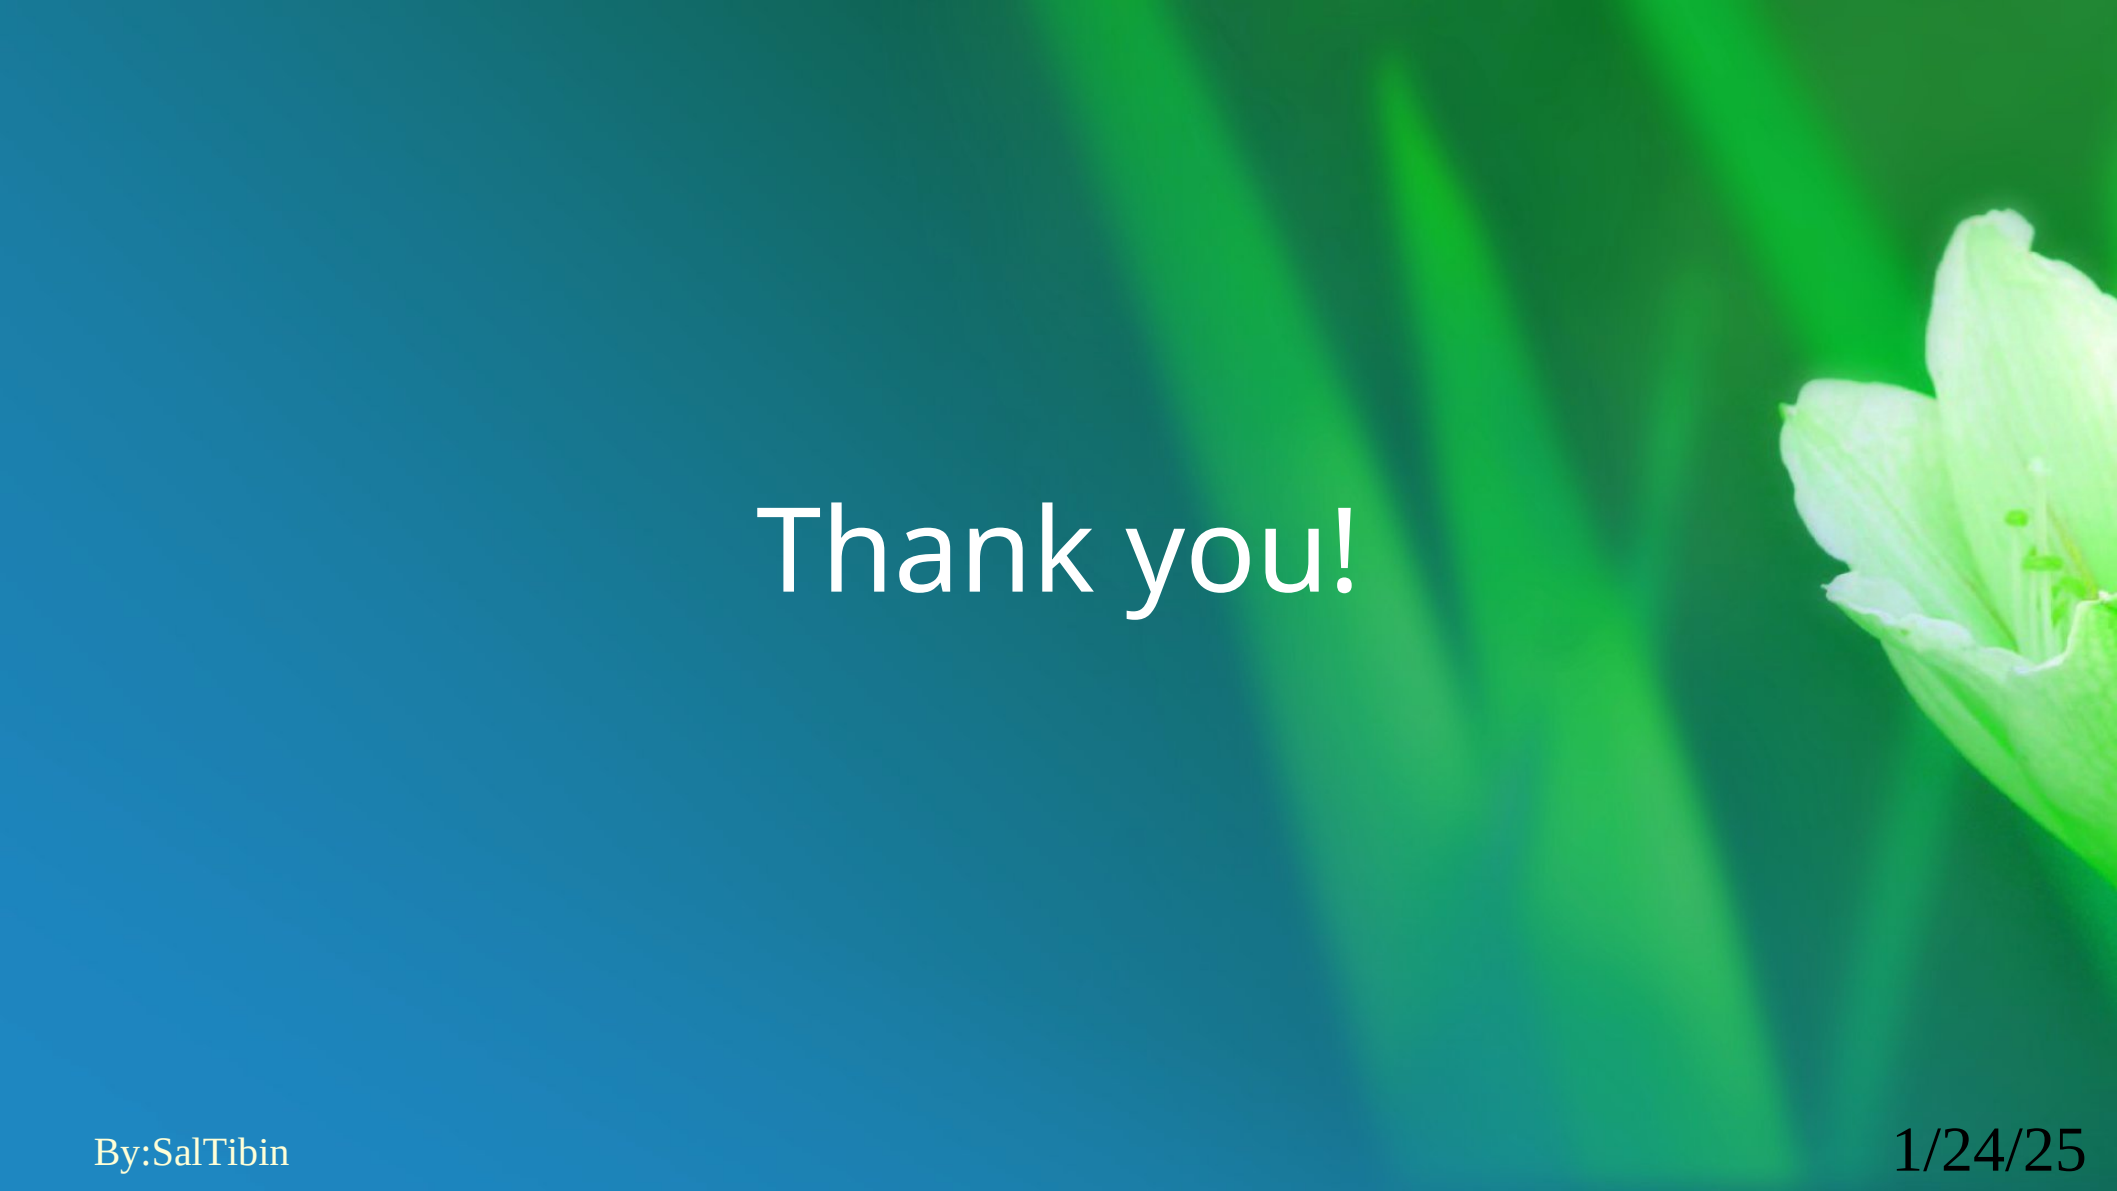

- PostGIS
- PostgreSQL

# How to setup Web Map Project Locally (Localhost)?

- After installing XAMPP in your machine
- Create project folder as example: webMap101.
- Inside that folder, create these folders:
  - **src** for your data source
  - **imgs** for images
  - **data** for data
  - **scripts** for JavaScript
  - **css** for external CSS
  - Create a file: **index.html**

# How to setup Web Map Project Locally (Localhost):-

- Copy that project folder into:
  - C:/xampp/htdocs/
- Linking Leaflet Style Sheet or downloading it.
- Linking Leaflet JavaScript or downloading it.
- Open the project folder using VS Code

Thank you!
